This is a form to declare your contents have originated from a country outside of the US or Canada, or contain items subject to the US Endangered Species Act or Canada Migratory Birds Convention. FedEx will only accept this form if it is accompanied by a shipping label or bill of lading. Problems with FedEx International Express Freight service FedEx International Express Freight is considered to be expensive, as it is priced more than its normal International Priority Service. The main problem with this service is that the FedEx trackers could get lost in shipments. When this happens, it can be very difficult to find the package. Most often, trackers are lost in shipments that are shipped to a warehouse or container yard. This is because, unless the packages are picked up from the delivery location, the tracking systems may not be able to locate the shipment. References Category:Logistics companies of the United States Category: FedEx (Treatment of primary hyperparathyroidism: single center experience in a family practice). To analyze treatment and results of primary hyperparathyroidism (PHPT) in a family practice. Retrospective study, by review of clinical records of patients with PHPT admitted to a family practice of Madrid, Spain, from 1991 to 1998. Demographic data, personal and family history, biochemical data, radiological, surgical and pathology data were recorded. With informed consent, from the pathology of each case a macroscopic report was obtained. A total of 139 cases were reviewed. There were 106 women and 33 men. Mean age at the time of the first evaluation was 49.4 years. Median age at the time of diagnosis was 53.1 years (SD 16.3). Pathologic calcium level, plasma phosphate and bicarbonate levels were all normal. Sixty-six percent of the patients had hypercalciuria, 42% had vitamin D deficiency and 35% had osteitis fibrosa cystica. Surgical exploration was performed in 95 patients and a parathyroid adenoma was found in 78 cases (82%). Forty-eight patients were treated with parathyroidectomy and 26 of them (54.2%) had persistent and/or recurrent hypercalcemia. Nineteen of the 26 cases that received primary surgery had a follow-up between 2 and 10 years. Patients with persistent hypercalcemia had older ages, lower levels of serum calcium and parathormone, lower levels of serum creatinine 82157476af
